EVENING WAVE · JULY 31 [Source](#)

Low-fee (~1–2 sat/vB) sweeps. Jul 31 vault (~0.51 BTC) still held. Aug 1: ~0.41 BTC passed through that vault to a hop address, then a delayed ~0.19 BTC victim consolidation joined the hop (now ~0.69 BTC). A separate Ocean (OCEAN.XYZ) miner-payout UTXO also touched the hop and was peeled off — possible same-operator lead, not counted as stolen. Distinct from the Kelbie vault, which also happened on July 31.

MORNING WAVE · AUG 1 [Source](#)

Blocks 960518–960523. Direct victim sweeps (~15–50 sat/vB) into one vault; honey-pot / duress-wallet report (Mk4 claim later withdrawn — seed was Mk3-origin).

Movement feed

Outbound spends of the reported consolidation from watched holdings, then followed destinations (up to hop 2). Later surplus that passes through a vault while its reported balance remains is ignored.

No outbound spends

Reported consolidation balances have not left the holding addresses.

Am I at risk?

Short checklist from Coinkite's Aug 1 advisory, Block's root-cause writeup, and WizardSardine's analysis. This tracker does not check your wallet — follow the official steps before moving funds.

LIKELY EXPOSED

Your seed is likely exposed if it was generated on vulnerable firmware. Fixed releases and later are safe for new seeds.

DEVICE	VULNERABLE	FIXED
Mk3	4.0.1–4.1.9, 5.0.1–5.0.3 (~40-bit)	4.2.0+
Mk4 / Mk5	Before Aug 1 patch (~72-bit)	5.6.0+
Q	Before Aug 1 patch (~72-bit)	1.5.0Q+
Edge (Mk4 / Mk5)	Before Aug 1 patch	6.6.0X+
Edge (Q)	Before Aug 1 patch	6.6.0QX+

FIRMWARE UPDATE IS NOT ENOUGH

Patching does not repair an existing seed. Generate a new seed on fixed firmware and migrate funds carefully.

ORIGIN OF THE SEED

Exposure follows where the seed was generated, not the device holding it today. Seeds imported elsewhere, or whose origin you cannot establish, should be treated as affected.

BEYOND THE MAIN SEED

Weak RNG also hit paper-wallet keys, clone / Key Teleport material, and some Secure Notes passwords — even when the BIP-39 seed itself came from dice (WizardSardine / Block).

LOWER RISK

At least 50 private dice rolls at seed creation. A long truly random BIP-39 passphrase (not the device PIN) may buy time, but weak passphrases are not a safe bet — still migrate when practical.

NOT THIS BUG

TAPSIGNER, Opendime, and Satscard use different codebases and are not affected. Mk1 and pre-4.0.1 Mk2/Mk3 firmware used the real TRNG.

Galaxy Research

Mapped the July 30 fingerprint set: 1,082.65 BTC across 1,196 addresses into four holdings.

Kevin Kelbie

July 31 post-scan wave (~45.9 BTC) after Block's scan window; similar markers, different RBF behavior.

Evan Schoenberg

Evening July 31 low-fee (~2 sat/vB) sweeps into a separate vault; Aug 1 hop consolidation (incl. delayed ~0.19 BTC) raised the watched cluster to ~1.20 BTC.

Ocean block 960511

Coinbase of block 960511 (tag OCEAN.XYZ) paid 0.06045759 BTC to a miner address that later sent to the Aug 1 hop vault; that UTXO was peeled off and is not counted as stolen.

Tomer Strolight

Aug 1 morning wave: duress-wallet honey pot swept into a ~0.33 BTC vault; Mk4 attribution later corrected to Mk3-origin seed.
