Coldcard and the limits of “don't trust, verify” [↗](#)

Bennet.org · Bennet · 3 Aug 2026

Starts with how a disabled flag routed seed generation to a predictable fallback, then turns to the harder questions: whether a flaw that cannot be patched retroactively could have been disclosed responsibly at all, where the responsibility sits, and why the author rejects laying it at the door of AI. Also defends the people who recommended the device in good faith, and argues the episode is a vendor failure rather than a case against self-custody.

Don't trust NVK, verify. [↗](#)

X · Zach Herbert · 3 Aug 2026

A long, densely linked rebuttal by the cofounder and CEO of Foundation Devices, one of the companies it says NVK attacked. It gathers years of quotes — each linked to the podcast, post or commit it came from — on the treatment of Passport and SeedSigner, the handling of security disclosures, and the GPL and trademark disputes. An interested party, and it says so, closing: "Do not trust NVK. Do not trust me either. Verify."

This Isn't the End of Bitcoin Self-Custody [↗](#)

Frank Corva's Newsletter · Frank Corva · 2 Aug 2026

Written for owners of an affected device: where to move funds, covering hardware and software wallets, custodians and multisig services, then an explanation of the firmware bug and a primer on entropy. Openly opinionated — it also argues a case against Coldcard and dice rolls, and for multi-vendor multisig.

Critical Coldcard flaw: what happened, who is affected, and what to do [↗](#)

Wizardsardine · Kevin Loaec · 1 Aug 2026

Walks through the entropy bug in seed generation, which Coldcard models and firmware versions are affected, and what owners of an affected device should do.

When random.bytes() runs but doesn't work [↗](#)

bitcoin++ Insider · Dusty Daemon · 1 Aug 2026

Traces the bug through the firmware commit history: an attempt to override a function left the hardware RNG disabled, so seed generation fell back to a weaker entropy source.

BTClock, Coinkite's GitHub takedown, and how it got there [↗](#)

Nostr · Djuri · 18 Nov 2024

A first-hand account by the maker of BTClock, written days after Coinkite reported his GitHub organisation for trademark infringement. Traces the project from a 2023 bet about building the cheapest possible ticker through to the takedown, and ends with an open invitation to talk. Kept in full below, because it lives on a relay rather than a website.
